From : Dr. A.G. Ilahude

Subject : JADE 95

Dear Michele,

Thank you very much for your fax of Sept. 19 and in responding to it I would like to inform you the following :

1. You as the chief scientist is the only one to fill in the questioner. The rest of the member can fill in the questioner when they arrive in Jakarta.
2. It is O.K. with us (Pak Basri Ganie and me) if you feel that it would be easier for you if you send your equipments through the French Embassy.
3. We are very glad and thankfull to know that you have managed to borrow a calibrated Guildline CTD and bring it with you to Jakarta. In that case we can indirectly calibrate both of our CTD at the Baruna Jaya I and II during our next cruise.
4. I will prepare the JADE 92 oxygen data and send it to you.
5. I believe Pak Basri will agree with the 6th November as starting date of our JADE 95 cruise, so that the plan will be as follow:

First leg of JADE 95 : 6 to 18 Nov. --- Jakarta - Kupang

Two days stay in Kupang : 18 to 20 Nov.

Second leg of Jade 95 : 20 to 2 Dec. --- Kupang to Kupang.

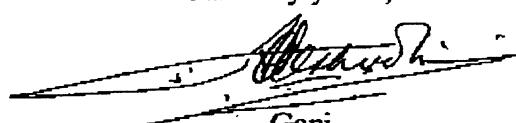

I will consult Pak Basri about this proposal.

6. According to her fax of 8 September to me, Nan Bray scheduled her equipments to arrive in Jakarta at the first week of October. So I think there will be no problem if she "would like to load the ship on the 3rd of November", since it can be done even earlier than that. "Baruna Jaya I" will be in Surabaya from 25th September to 15th October for maintanance docking.

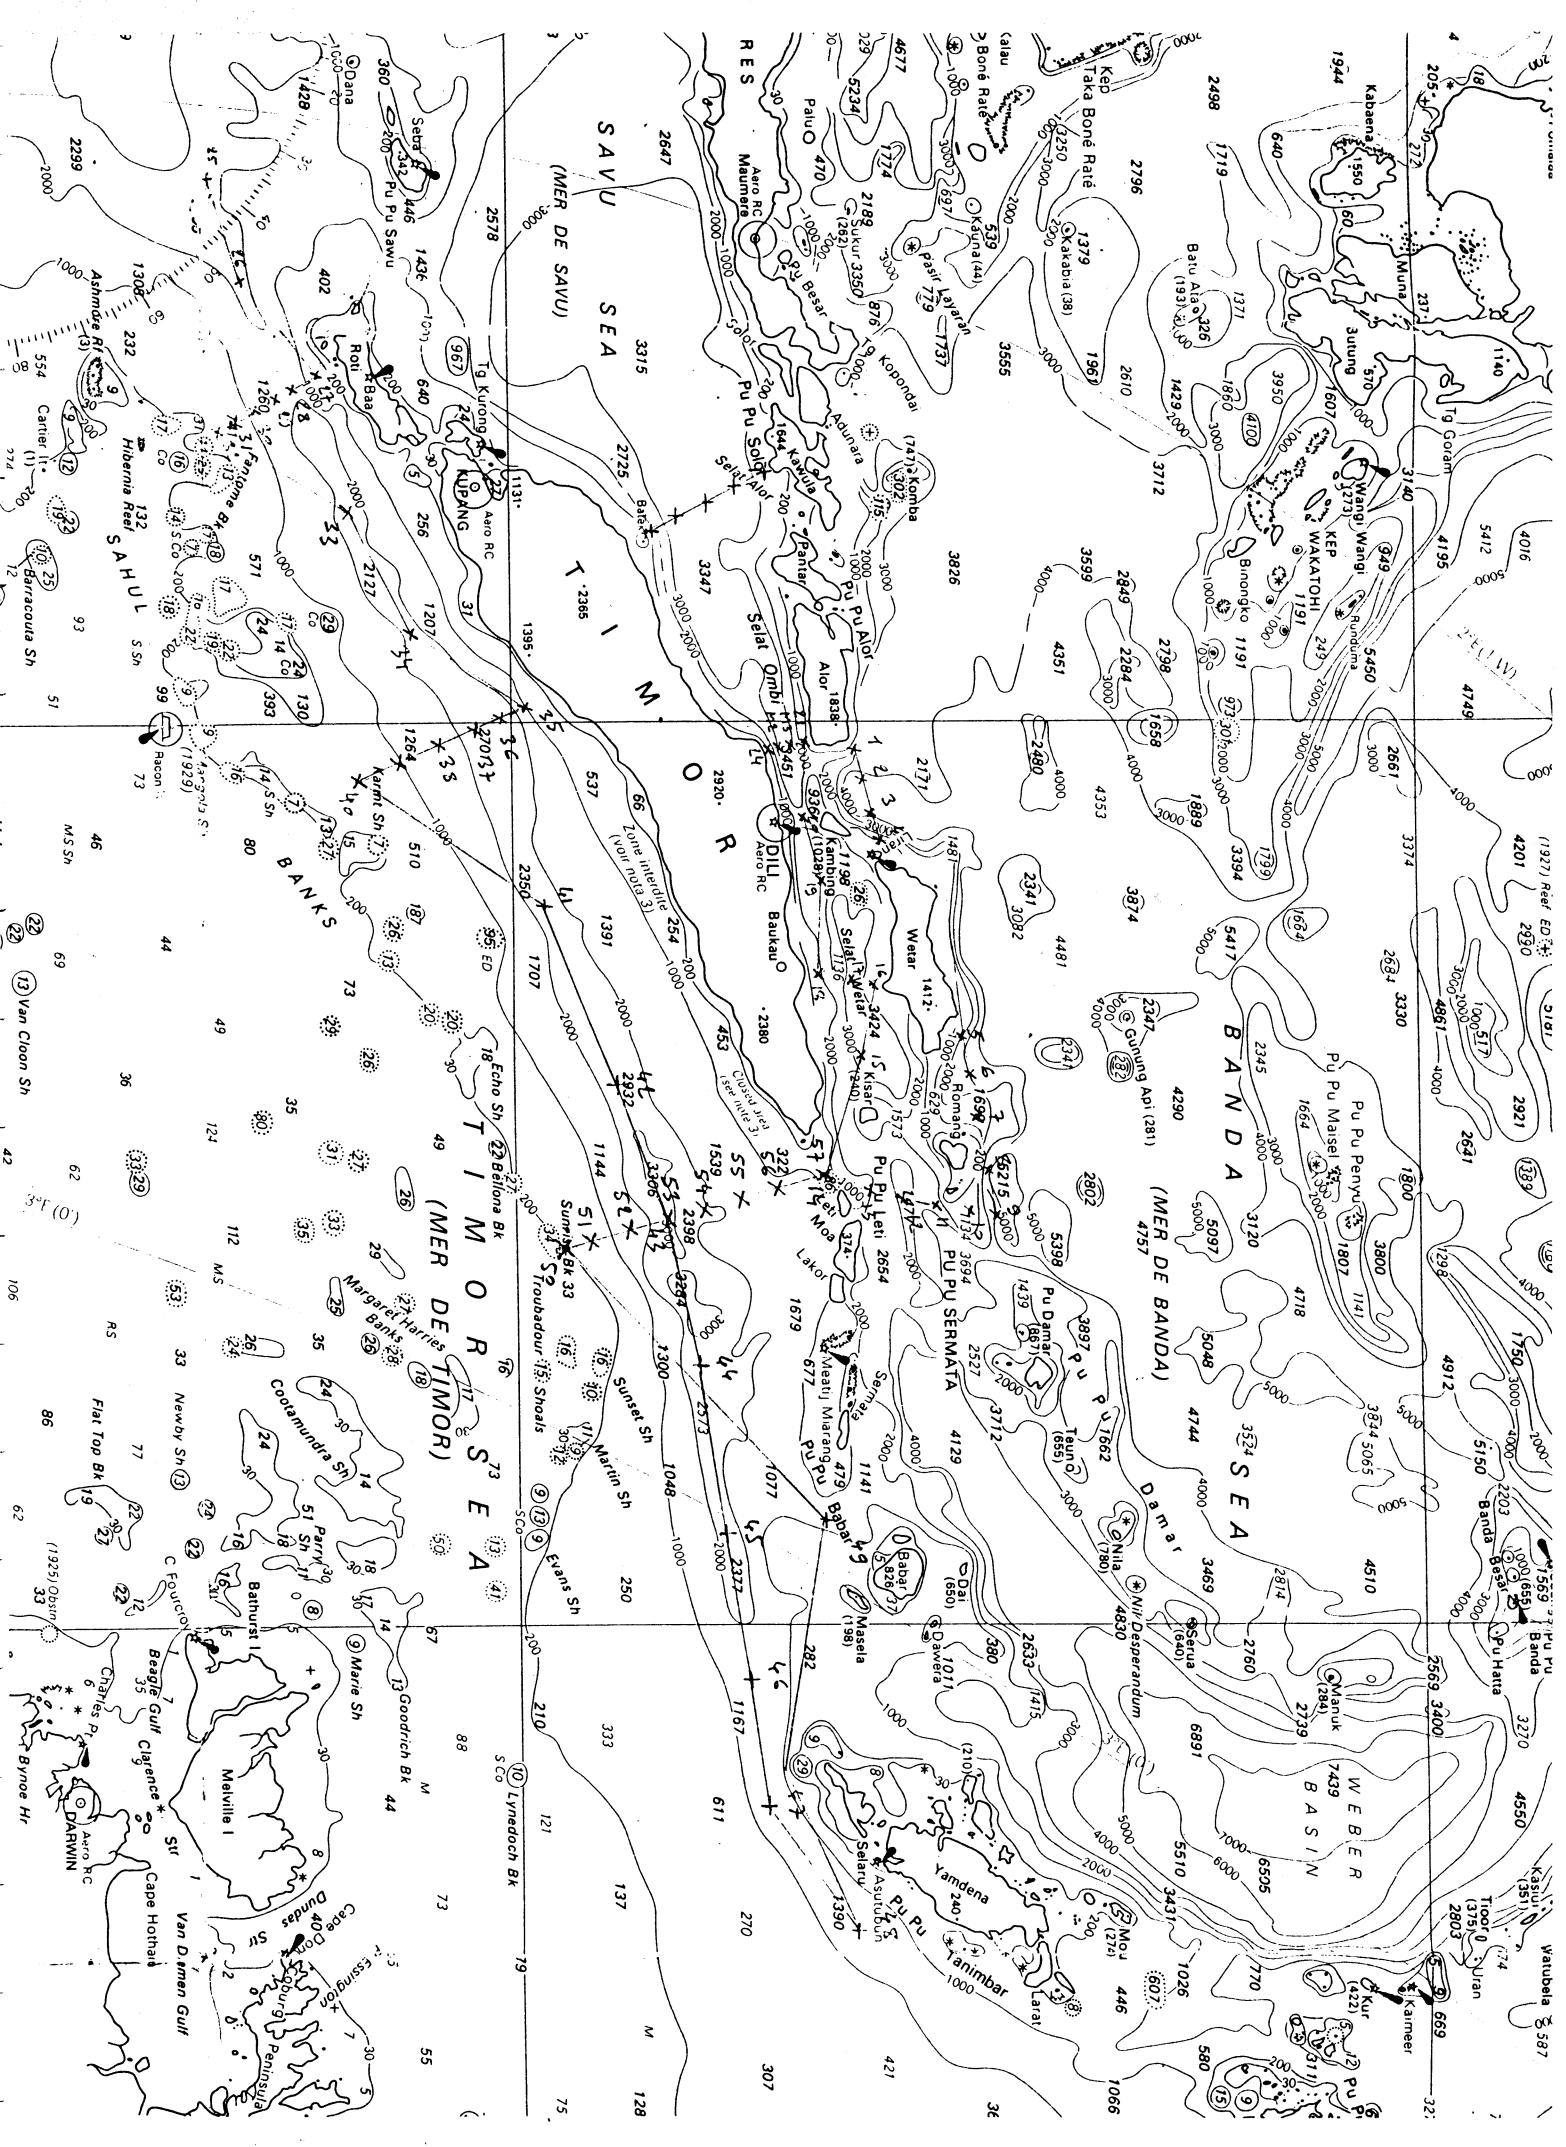

Yes, I took a 3-week vacation last and this month but hardly used it for going out, away from Jakarta. There was the Sixth National Science Congress to attend to (11 to 15 September) and two coming Seminar to prepare to (October : Japan - Indonesia workshop on the throughflow and in November : National Marine Seminar, to which I only submit a paper but not to attend). I hope to see you at the October Workshop. Toutes mes amitiés à vous et Robert.

cc. Pak Basri Ganie
Dr. Nan Bray.

Sincerely yours,

Ganie

JADE 95 CRUISE

on board the
R/V BARUNA JAYA I

7 November - 2 December 1995

CRUISE REPORT

On board the Baruna Jaya I, the 1st of December 1995

Michele Fieux

I - OBJECTIVES OF THE CRUISE

The JADE 95 cruise is carried out under the « Arrangement between the Government of the Republic of France and the Government of the Republic of Indonesia on Scientific and Technological Cooperation » signed in Jakarta on July 13th, 1988, extended in July 1991 and in July 1994.

The objective of the JADE (Java Australia Dynamic Experiment) programme is the study of the throughflow between the Pacific Ocean and the Indian Ocean which represents a fundamental link as well in the study of the general oceanic circulation (WOCE programme) as in the climatic studies which are related to it (TOGA programme, Global Change, CLIVAR). It includes the measurement of the characteristics of the water masses to study their origin and their mixing. It also includes direct current measurements in narrow and deep straits linking the Banda Sea and the Indian Ocean.

A scientific collaboration between French and Indonesian scientists permit to carry out two cruises on board the Marion Dufresne in 1989 and in 1992, and three cruises on board the Baruna Jaya I in 1990, 1992, 1993

The JADE 95 cruise on board the R/V BARUNA JAYA I is the fifth cruise of the JADE programme.

The specific objectives of this cruise were:

- to measure the evolution of the water masses along the two routes from the south Banda Sea to the Indian Ocean through the Wetar Basin and Ombai Strait into the Sawu Sea, and through the different passages into the Timor Sea (see the stations location on Figure 1).

- to measure the currents in both deep passages north and south of Timor, i.e. in Ombai strait and Timor Passage, to determine the partition of the throughflow going from the Banda Sea toward the Indian Ocean.

II - SUMMARY OF THE CRUISE

1) First leg

Two of us were welcomed on board by Captain Daryanto on the 6 November when the 181 pieces of equipment (brought by Karga Walon Agent) were loaded on board. Two pieces were missing, they were found at the airport on the 7 morning while the american container was loaded for the next cruise. We embarked on the same day at 03.00 and checked the weights which had been prepared in Jakarta. The R/V BARUNA JAYA left Tanjung Priok, Jakarta, at 16.30 on the 7 November 1995 for a 12 days leg. The list of the French and Indonesian participants is given in Annex 1. The cruise objectives were presented during a short meeting on the 8 November.

To test the CTD cable and to wrap it on the drum as smoothly as possible under tension, a deep location along the route towards Alor was choosen in the Flores Sea. It was only 4354m deep so we could not pay out more than 4000m of cable (with 100 kg at the end of the cable). Due to the bad wrapping below 4000m it took nearly 1500m to recover a correct spooling, at least in the middle of the drum. The operation, done on the 10 November, took 6 hours and lead to the decision of reducing the depth for most of the stations of the first leg down to 1300m because of the time consuming when loading the cable on the winch, and to reduce the number of stations. After the installation of the french calibrated Guildline CTD associated to the indonesian deck unit and HP and PC recorders, a test station down to 1000m was done north of Flores on the 11 November.

The CTD stations started north east of Alor on the 12 November, and continue noth-east of Wetar, in the south Banda Sea, then towards east of Timor, between Timor and Leti and in the Wetar Basin. 20 stations were carried out during the first leg (see Figure 1). When the station was deeper than 1000m, there was sometimes a problem of memory on the PC ; in that case the HP version was copied through the french HP system. To calibrate the CTD along the cruise, salinity samples were measured with a Guildline Autosal salinometer.

During the same period the currentmeters were started and the moorings were prepared on the deck with the steel cable on one winch and the synthetic cable on the other winch.

A lot of Niskin bottles were leaking either at the bottom or because some handles were broken and the taps were difficult to manover. They were all taken out and carefully oiled with silicone but spare parts should be acquired to keep them in correct use.

Before arriving on the mooring site, the description of the mooring launching operations were discussed during a short meeting on the 15 th of November. On the mooring site, in Ombai Strait, a bathymetric survey has been carried out (Figure 2 and 3) together with estimation of the ship drift at several locations near the axis of the Strait and at different times of the tide to be ready for the launching the next morning (Figure 4).

Mooring M3 included 6 Mors currentmeters and 1 Aanderaa currentmeter spread between 310m and 2010m with a Mors acoustic release; for security, an Argos beacon was installed on the top subsurface buoy which will start to emit only when the buoy arrives at the surface if the mooring get broken during the period of measurements (Figure 4). The currentmeters were started at 6.00 (LT=GMT +8) on the 16 November. The deployment of mooring M3 started at 8.00 on the 16 November and the weight was launched at 14.43, at $8^{\circ}28'53''S$ - $125^{\circ}06'00''E$ with a depth of 3285m. After another bathymetric survey near the second launching point and further estimations of the ship drift during the night, the deployment of the second mooring M2 with an ADCP at the top started at 7.40, on the 17th of November. The weight was launched at 11.51 (3255m) and the first three packages of buoys sunk, but few minutes later came back up at the surface! The Captain sent the ship launch immediately to retrieve the mooring lying at the surface. The mooring was back on board at 16.13. The steel cable broke just above the acoustic release which was lost with 1300m of synthetic cable and the weight. As we had only one acoustic release and one weight left, the decision was taken to cancel the Timor mooring and to try to reinstall the ADCP mooring in the south of Ombai Strait during the second leg to get the currents in the upper layer.

We arrived in Kupang on the 18 November for refillment and to embark two americans, Thomas Moore and Paul Harvey, for the two days work of the Arlindo programme to be carried out during the second 12 days JADE leg. To get their equipment out of the container embarked in Jakarta, they had to pick up the container from the hole with a crane from Kupang and they unloaded it on the quay on the 19. The water was supplied on the 20 morning.

2) Second leg

The ship left Pelabuhan Tanau (Kupang) at 11.25 on the 20 for the second leg.

Stations 21 and 22 were done on the Indian Ocean side of the Timor Passage. Three sections across the width of the Timor Sea were carried out (stations 23 to 27, 30 to 34 and 44 to 49) and along the Timor Sea axis up to Tanimbar islands (st. 21,22,24,28,29,31,35,36,37,38,39,40,41,42)(see Figure 1). A list of the stations is given in Annex 2. We encountered the same problems with the PC recording and had to go through the HP to recover the data of several stations. At station 21 the pressure sensor

installed on Niskin bottle 1 cracked and was replaced. At the end of station 25 the salinometer was not functioning well and we had to check the pumps and the air circuit; the cell was rinsed with a Decon solution as bubbles start to form. At station 30 the Suber rosette started to dysfunction and continued at station 31. It was opened between station 31 and 32 but could not be fixed in such a short time, so it was not used during the stations 32, 33 and 34. During the route between station 34 and 35 it was fixed and sampling was carried out again at station 35. The americans carried out a test of their towed ADCP after station 35 for two hours at different speeds up to 8 knots but it could not be towed faster. At station 39 the rosette sampler disfunctionned again, and three batteries were changed. A complete set of batteries is needed on board; The cables for the Ombai mooring were prepared on the two winches, using part of the Timor mooring cable to replace the cable lost. At station 42 the conductivity of the CTD was out of range. The sea surface was covered with oil. After rinsing the CTD cell with a detergent and moving the ship to a cleaner place, the values were correct again. The ship had to stop for two hours to repare a leak of oil in the engine. To keep enough time in Ombai Strait, one station was deleted on the section east of Timor. After the station between Timor and Leti a bathymetric cross section of the middle of the strait was done to see if there was a deeper passage. Indeed east of station 49, closer to Leti than to Timor, there was a steep trench down to 1504m, too steep to dare to send the CTD without a pinger.

Then we steamed directly to Ombai Strait where we estimated ship drift every 30 minutes from the chosen mooring position before dawn. The surface drifts were 2 to 3 knots East and South-East. The currentmeters were started at 6.00 (LT=UT+8) on 28 November. The GPS was not working for a while and the surface current turned to the north, so the launching of the M2 mooring (Figure 5) started at 7.58; the weight was launched at 11.17 with a depth of 3305m. At 13.45 the americans, Thomas and Paul, went to the coast of Timor with their rubber boat to look for a site to install a pressure gauge. Then the 4 CTD stations across the strait were finished at 01.25 on 29 November.

The next morning, the americans, Paul and Thomas, left on the rubber boat with the pressure gauge to install it near Tg Parimbala on the north coast of Timor. They came back at 10.15. We went to the north of the strait, to look for a good site on the coast of Alor. The weather was fine and they decided to try to install the second pressure gauge directly in the afternoon. They started at 14.00 and came with the instrument because the slope was too steep to launch it at that location. They were back at 16.00 and as they needed to prepare for the next day no ADCP sections were carried out. So one station in the middle of the strait for comparison with the Indonesian CTD was decided. On the 30 November, they installed the second pressure gauge on the coast of Alor.

The last section across the Sawu Sea was carried out just before arriving in Kupang on the 1 December around 21.00. All together 59 stations were carried out and two deep currentmeter moorings were installed in Ombai Strait.

III - SOME PRELIMINARY RESULTS

1) CTD data

On the two sections A(st1 to 4) and B (st 5 to 9) done in the south Banda Sea the water masses are similar below $T=6^{\circ}\text{C}$. Above, the salinity maximum of the North Pacific Subtropical Water (NPSW) and the salinity minimum of the North Pacific Intermediate Water (NPIW) are much less marked on section B than on section A which is closer to Makassar Strait. The vertical mixing is stronger in B than in A. The subsurface salinity minimum and the salinity in the thermocline is also lower near Alor

than east of Wetar. On section C (st 9 to 14), in the thermocline, between 23° and 15°C, the stations are similar. On section D (st 15 to 20), in the Wetar Basin, water masses below 20°C are similar to section C, but above, the subsurface minimum disappears and the water masses are more saline than on section C perhaps due to the influence of water from the south. On the Roti section (st 23 to 27) the salinity is homogeneous between 8° and 18°C and corresponds to the throughflow water; between 8° and 4°C there is a transition layer between the throughflow water and the Deep Indian Ocean Water which appears below 3°C. In the east of Timor Sea, appears a high subsurface salinity maximum due to the influence of the water formed in the Arafura Sea where evaporation exceeds precipitation. At depth, as the basin becomes shallower towards the sill with the Aru basin, the characteristics of the Indian Ocean Deep Water disappears.

The calibration of the CTD needs all the salinity measured with the salinometer to compare with the CTD measurements. This will be done after the end of the cruise as well as the calibration of the Indonesian Guildline CTD and will be send soon to our Indonesian Colleagues in BPPT and LIPI.

2) Bathymetry of Ombai Strait

Before launching the two moorings in Ombai Strait it was necessary to get a bathymetric survey of the area. The track of the survey with the depths is shown on Figure 2. The isobaths every 100m are shown on Figure 3. The Ombai Strait in its narrowest part between Alor and Timor is very steep on both sides with a nearly flat bottom in between, around 3280m. We choose to install the moorings on the northern and southern ends of the flat part (M2 and M3 on Figure 4).

3) Surface drift in Ombai Strait

The day before the launching, during the bathymetric survey, several ship drift were carried out for at least 20 minutes around the axis of the strait. There was no wind, so the ship drift corresponds closely to the actual surface current. The currents were strong, reaching 3 knots towards the west, south and southwest during the period between the 15 November at 12.00 and the 17 November at 5.00 (Figure 5). On the 28 November, the surface drift were as strong towards the East and South-East. The tides seems to influence strongly the surface current in the strait.

IV - CONCLUSION

Among the objectives of the cruise, most of them were reached and it is due to the excellent cooperation with our Indonesian colleagues and the crew of the ship. But the breaking of one of the mooring cable prevented us to get the partition of the flow through the two passages north and south of Timor. We hope to get the current structure in Ombai Strait and its annual variability when we will retrieve the two moorings at the beginning of 1997.

V - AKNOWLEDGMENTS

We wish to specially thank Captain Daryanto and his crew for their warm hospitality and their generous support during all the cruise particularly during the moorings deployment which was crucial for the programme.

We greatly appreciate the hard work done by the Indonesian team led by Dr. Abdul Gani Ilahude on the CTD stations with Mustafa, Jonathan, Tatang, Fadli, Wahyu and Handoko, on the oxygen and nutrients measurements with Mardanis and

Rusmintardi, and on the sampling and salinity measurements by Ltn. Cortje, Djoko Cahyadi, Sri Kuntjoro and the students Agus Prasetyo, Haslinda and Winadi, and the great help they provide with enthusiasm during the mooring deployments.

We wish to thank Philippe Garnier, Conseiller Scientifique Technique et Culturel à l'Ambassade de France for his help in the organization of the cruise.

We acknowledge the great support of INSU who allowed to get the specific equipment for this programme and who authorized the very efficient and crucial participation of Claudie Bournot. We also acknowledge the support of the French Ministry of Foreign Affairs and of Ifremer for supporting the cruise.

Professor M.T.Zen and his team at BPPT led by Ing. Basri Ganie, have been supporting this Franco-Indonesian cooperative programme since the beginning and have put a lot of continuous efforts in the fulfilment of the scientific cooperation, we wish to thank them warmly at the end of this successful cruise.

Jakarta,
KOMANDAN KAL. BARUNA JAYA I

DARYANTO

MAYOR LAUT (P) NRP. 9484/P.

CALIBRATION AND DATA REDUCTION

The different steps used to obtain the definitive hydrological data are :

- 1° Calibration of the sensors : for this cruise, pressure, temperature and conductivity.

- 2° Validation and reduction of the raw data

- 3° Computation of the hydrological parameters, using Joint Panel on Oceanographic Tables and Standards (UNESCO Technical Papers in Marine Science n° 44).

I - CALIBRATION OF THE SENSORS OF THE CTD GUILDLINE 8515 N° 52426

The temperature and pressure sensors are calibrated by the Metrology Center of IFREMER in Brest. The conductivity and oxygen sensors are calibrated *in-situ* by comparison with the samples taken with hydrological bottles.

P = (1,001531 x ctd P) - 3,0671			P = (1,001197 x ctd P) - 3,4524		

The mean of the calibration before the cruise (July 95) and after the cruise (February 96) give the pressure polynomial (for up and down casts) :

$$P_{\text{ctd}} = 1.001364 * P - 32.5975$$

The calibration data are plotted on Figure 1.

The Figure 2 shows the evolution during the cruise of the deck pressure (zero point shift) at the beginning and the end of each cast, and the zero point shift of the calibration polynomial. To obtain the adjusted pressure, after applying the polynomial, we have to add to the values a quantity d_p : the difference between the zero point shift of the calibration and the zero point shift of the considered cast. This quantity d_p is different for each cast.

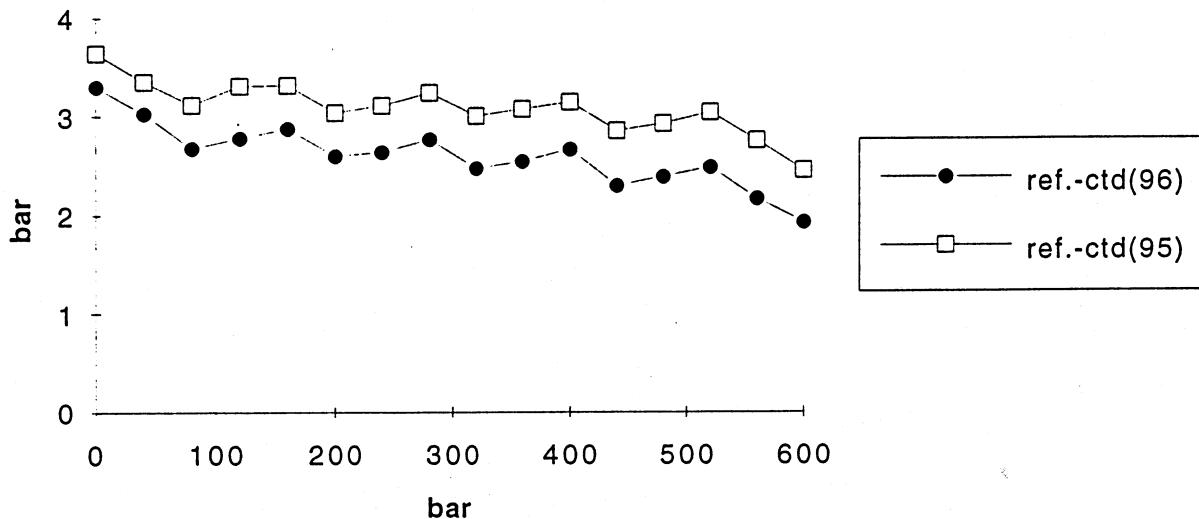

Figure 1

Pressure Calibration (in bar)

$$\text{Feb. 96: } P = (1,001531 \times \text{ctd } P) - 3,0671$$

$$\text{July. 95: } P = (1,001197 \times \text{ctd } P) - 3,4524$$

$$\text{Mean calibration: } P = (1,001364 \times \text{ctd } P) - 3,5975$$

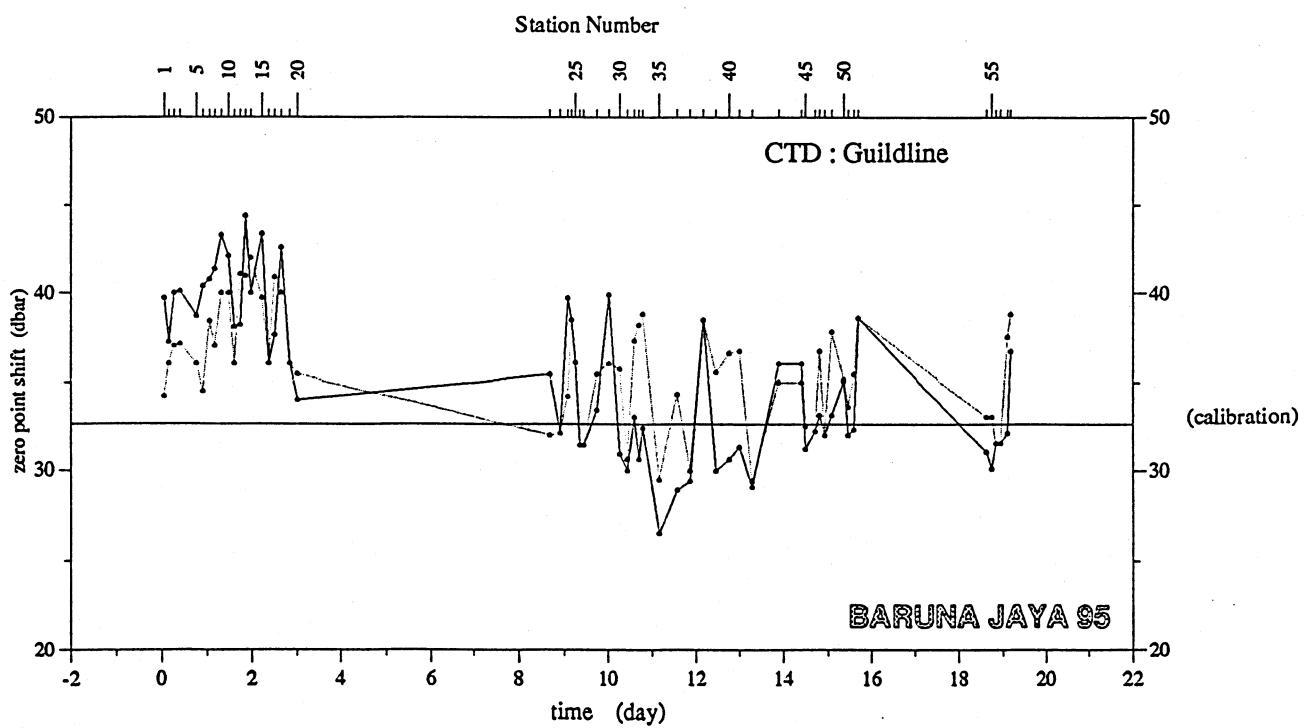

Figure 2 : Deck pressure

Temperature calibration of July 95 (in °C)
 $T = (0,9990504 \times \text{ctd } T) + 0,04617$

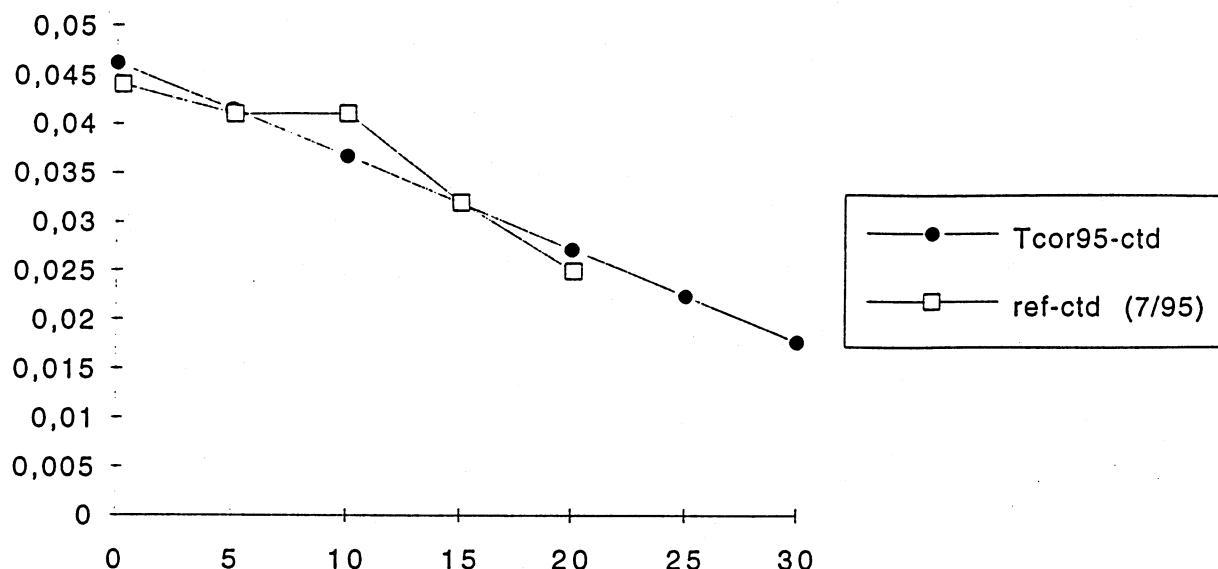

Figure 3

Temperature calibration of February 96 (in °C)
 $T = (0,999315 \times \text{ctd } T) + 0,03967$

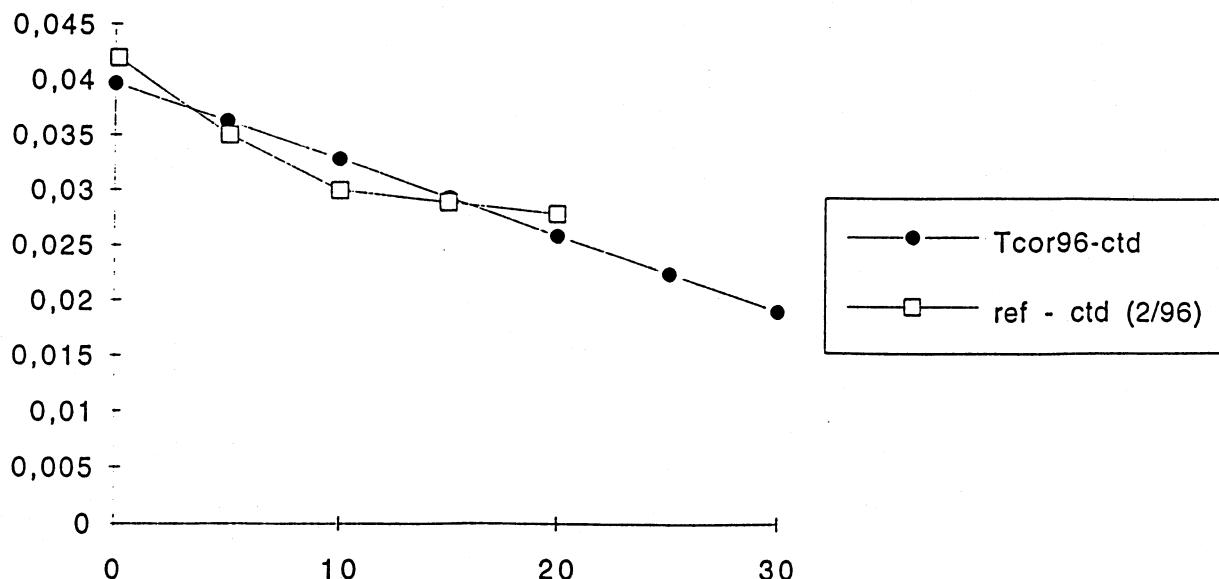

Figure 4

B - Temperature

In all the computations we use the international scale of temperature (IPTS90)(UNESCO Technical Papers in Marine Science n° 44).

TEMPERATURE CALIBRATION FOR JADE 95 OF CTD GUILDLINE 8515 n°52426 FROM INSU					
Calibration of Feb. 96 (with Guildline T sensor 87401 n°49494)			Calibration of July 95		
Ref. Temp.	ctd Temp.	Ref T - ctd T.	Ref. Temp.	ctd Temp.	Ref. T-ctd T

Ref. Temp. = a x ctd Temp. + b			Ref. Temp. = a x ctd Temp. + b		
a =	0,99931473		a =	0,99905041	
b =	0,03966968		b =	0,04616615	
Feb. 96 polynomial calibration			July 95 polynomial calibration		
$T = (0,999315 \times \text{ctd Temp}) + 0,03967$			$T = (0,9990504 \times \text{ctd Temp}) + 0,04647$		

The mean of the calibration before the cruise (July 95) and after the cruise (February 96) give the temperature polynomial (for up and down casts) :

$$T-\text{ctd} = 0.9991827 * T + 0.04292$$

The Figures 3 and 4 gives the differences between the temperatures of reference and the CTD temperatures during the two calibrations.

C - Conductivity

1 - Method

The salinity measured on the sample (S-hydro) allows to calculate the in-situ conductivity (C-hydro) at the pressure (fitted P-ctd) and temperature (fitted T-ctd) conditions of the sample :

(S-hydro, fitted T-ctd , fitted P-ctd) -----> C-hydro

UNESCO (JPOTS)

$C(35,15,0) = 42.914 \text{ mmho/cm}$

To calibrate the conductivity sensor, we have to compare the raw ctd conductivity C ctd and the in-situ conductivity C hydro, and to fit these two values, using the least square method. A first computation is made with all the sample points., with a filter 2.8 times the standard deviation. The sample points for which the difference of conductivity is greater than the filter are eliminated. The process is repeated until all the differences of conductivity are inferior to the filter.

2 - Results

The results of the calibration program are obtained from a file containing the cast number, the sampling bottle number, calibrated P-ctd , calibrated T-ctd , raw C ctd, S-hydro. This file is obtained from a first raw file (here 303 points), containing the cast number, the sampling bottle number, raw P ctd, raw T ctd, raw C ctd, S-hydro, by calibration of pressure and temperature, and suppression of the bottle samples for which the difference between S-hydro and a first computation of S-ctd is too large (graphic control).

A first computation is made with all these sample points (276 are retained). The chosen filter (0.0201) is 2.8 times the standard deviation (0.0072). From the 276 points, 231 points (83.7 %) are kept, after 8 runs, to calculate a first degree polynomial; 45 points (16.3 %) have been eliminated.

$$C-ctd = 1.00175 * C + 0.04061$$

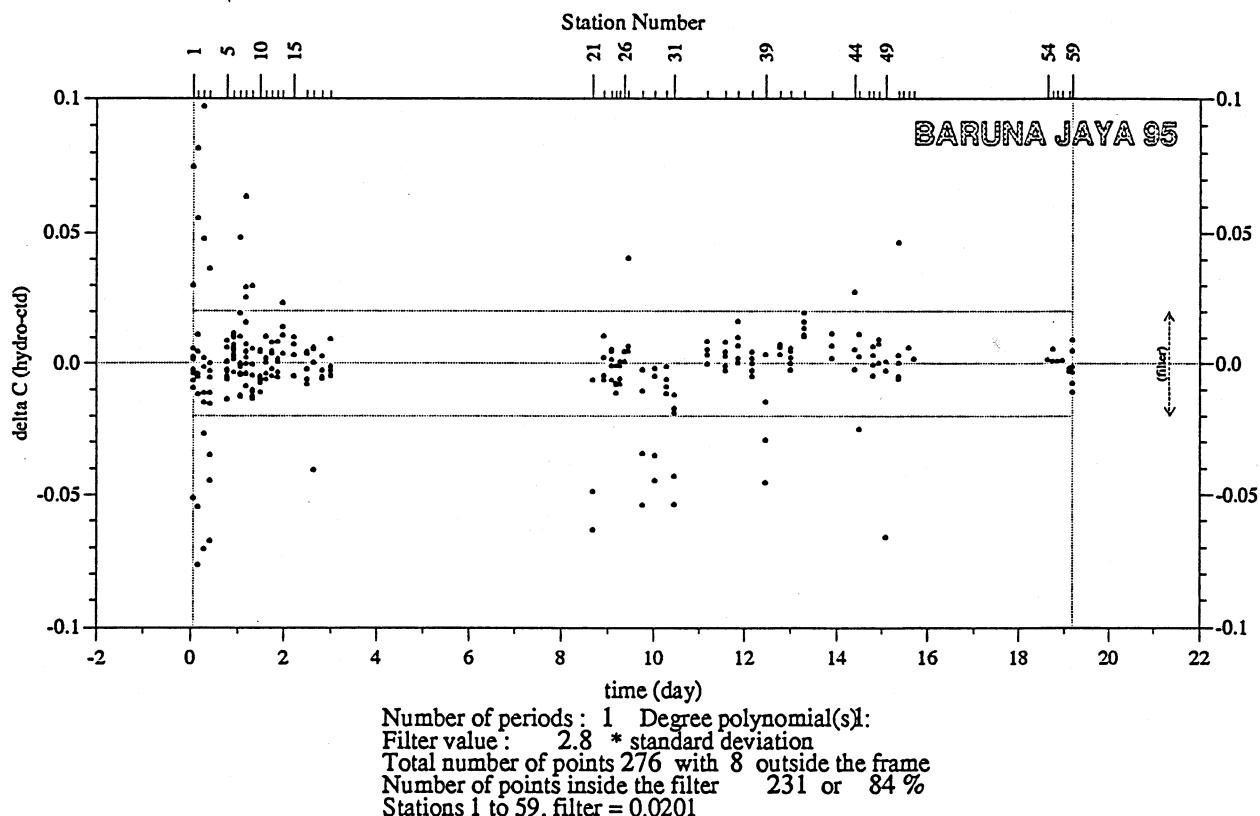

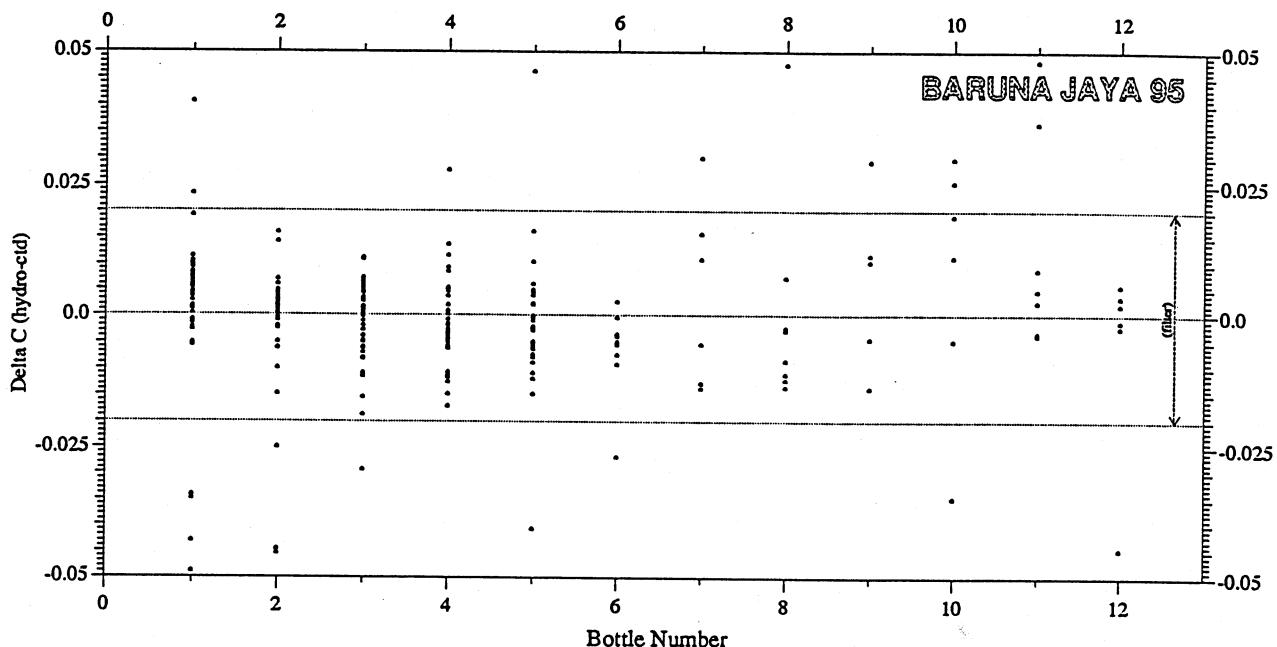

Figure 5 : Delta C (hydro-ctd) versus time

On Figure 5 is given the repartition of the differences ($C\text{-hydro} - C\text{-ctd}$) versus time. The differences are centered around zero, which shows the good adequation of the polynomial.

The sampling bottles worked well (no suspected leakage), as shown on Figure 6 : the points placed outside the limits of the filter are equally distributed (bottle 1 is the deepest one).

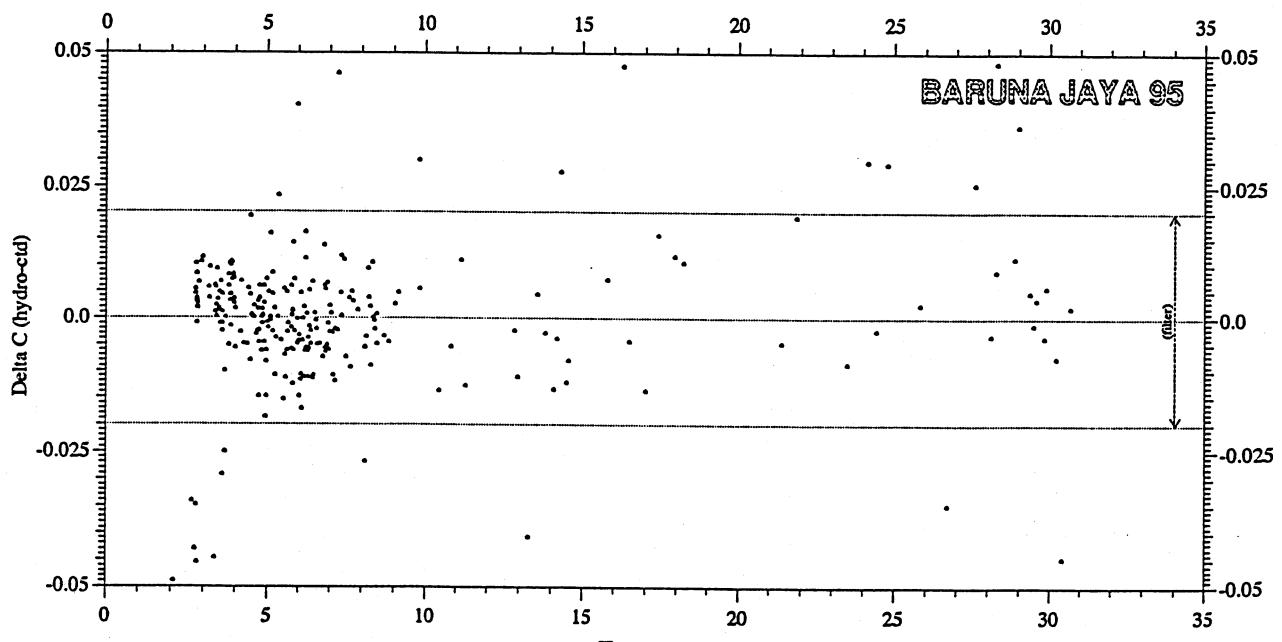

The Figures 7 and 8 show a good distribution of the conductivity differences around zero, as well as the Figure 9. In this last case (distribution of the conductivity differences in terms of pressure) it is sometimes necessary to apply a pressure correction to the differences, by means of a polynomial, equally calculated by the least square method.

This good distribution of the differences of conductivity and salinity around zero can be observed equally on the histograms of the Figures 10 and 11 .

Number of periods : 1 Degree polynomial(s):
 Filter value : 2.8 * standard deviation
 Total number of points 276 with 22 outside the frame
 Number of points inside the filter 231 or 84 %
 Stations 1 to 59, filter = .0201

Figure 6 : Delta C versus bottle number

Number of periods : 1 Degree polynomial(s):
 Filter value : 2.8 * standard deviation
 Total number of points 276 with 22 outside the frame
 Number of points inside the filter 231 or 84 %
 Stations 1 to 59, filter = .0201

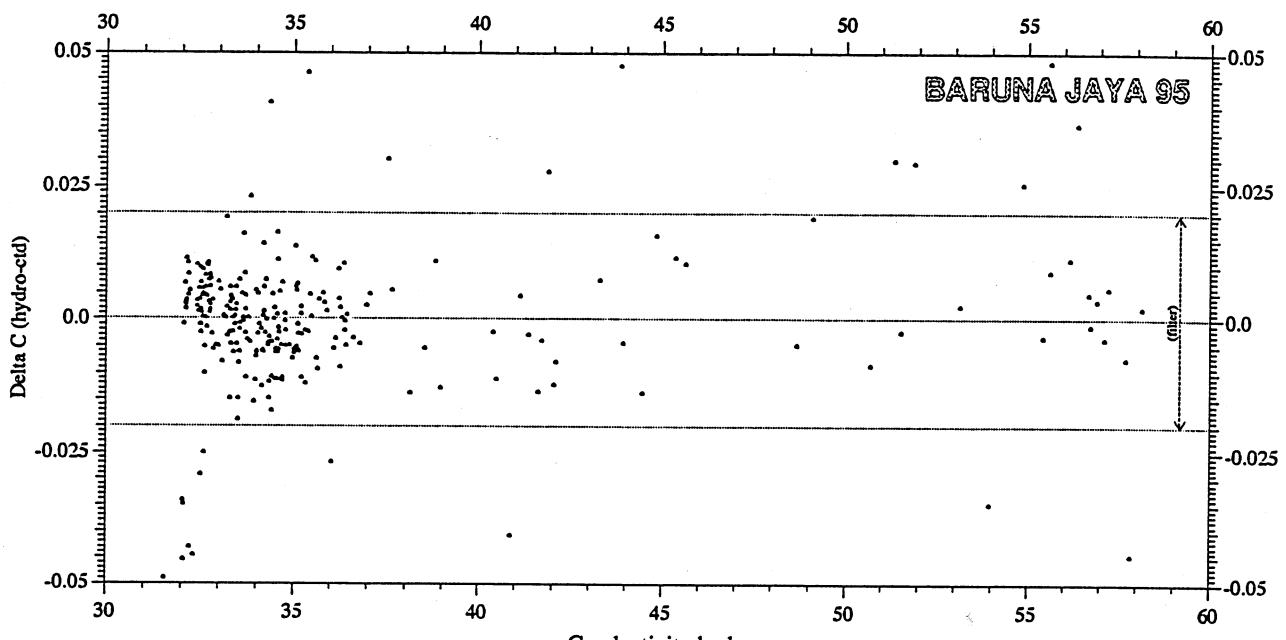

Figure 8 : Delta C versus conductivity

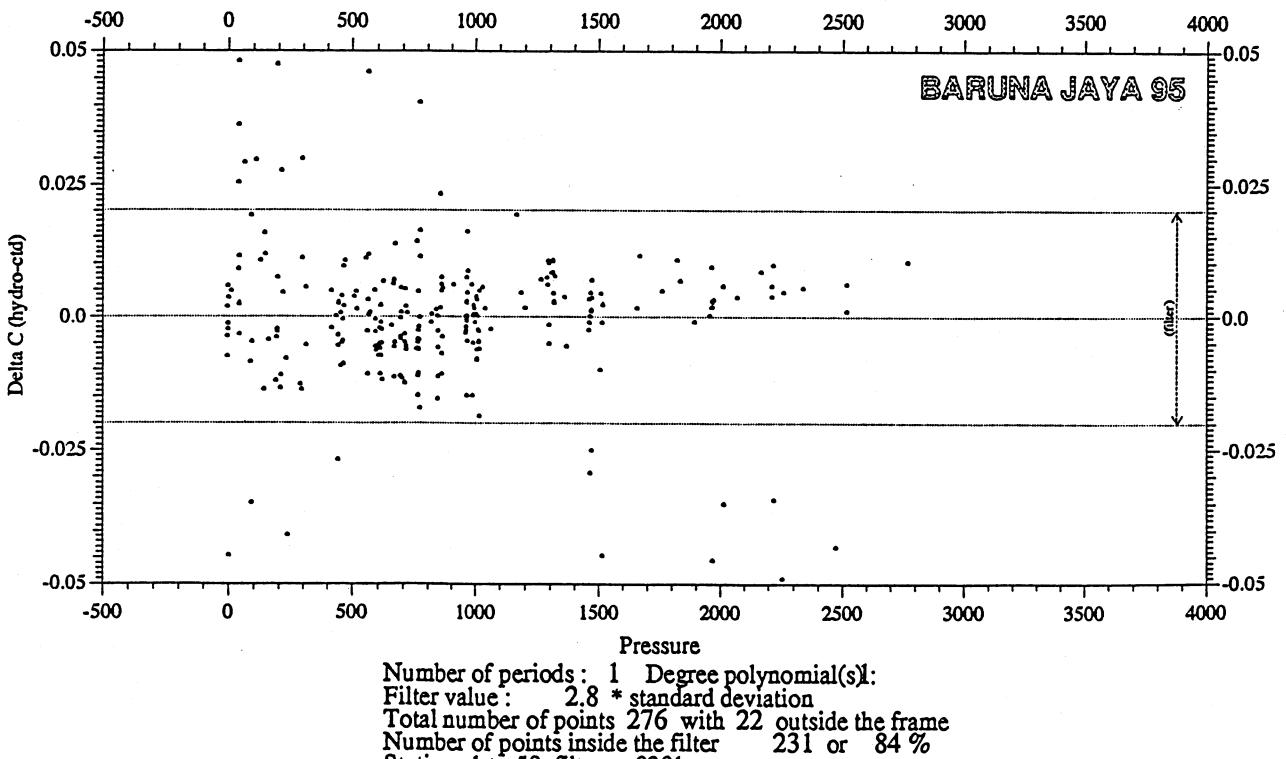

Figure 9 : Delta C versus pressure

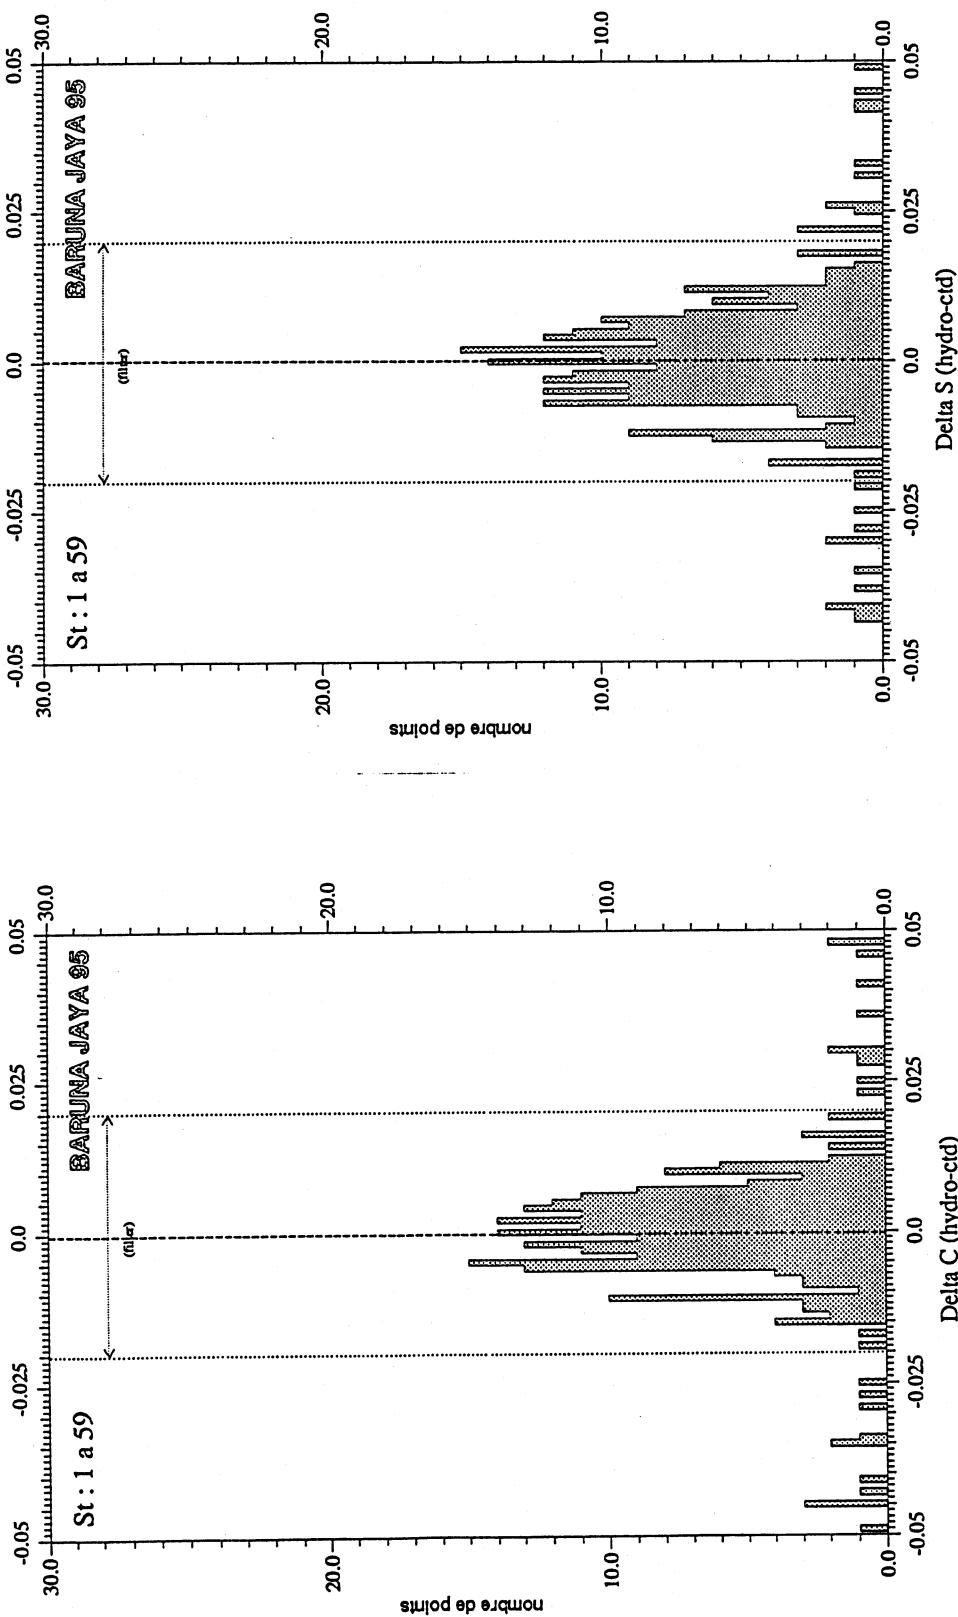

Figure 10 : Distribution of the differences of conductivity

Number of periods : 1 Degree polynomial(s):
 Filter value : 2.8 * standard deviation
 Total number of points 276 with 22 outside the frame
 Number of points inside the filter 231 or 84 %
 Stations 1 to 59, after calibration, filter = 0.0201

Figure 11 : Distribution of the differences of salinity

Number of periods : 1 Degree polynomial(s):
 Filter value : 2.8 * standard deviation
 Total number of points 276 with 23 outside the frame
 Number of points inside the filter 230 or 83 %
 Stations 1 to 59, after calibration, filter = 0.0201

II - VALIDATION AND REDUCTION OF THE DATA

The reduction of the data consists in obtaining mean data at every dbar, following the A. Billant Method (IFREMER Reports, 1984, 1986 and 1996).

The raw pressures are calibrated, with the method described in I - A.

Then, for each set of P,T,S data, each parameter is compared to its precedent calibrated value; if the difference between two consecutive values is greater than the chosen filter, the complete set of data is suppressed. The kept sets are put in a temporary array centered on P.ref (fixed value in dbar), between P.ref-1 and P.ref+1. The mean value is assigned to the pressure P.ref; it can be calculated only if at least 25% of the raw data situated between P.ref-1 and P.ref+1 are kept; otherwise the level P.ref is suppressed.

The reduction to 1 dbar programs use the (p,t,c) calibration polynomials. In the gradient zones, where the variations of temperature and salinity are very strong, density inversion can be observed. We can observe also salinity inversions in the deep homogeneous layers. A flag is then applied to every density inversion greater than 0.005. The temperature, pressure, salinity and density apart this flagged values are checked (graphic control), and the flagged levels are suppressed if necessary.

A second reduction to 10 dbar is calculated by means of an arithmetic mean in the P.ref-5, P.ref+5 layer. From these mean temperatures and salinities, are calculated the potential temperatures and densities.

At last, we obtain two sets of data for 60 casts (stations 0 to 59):

- 1 dbar data : P, T, S.
- 10 dbar data : P, T, Theta, S, Sigma theta.

III - HYDROLOGICAL PARAMETERS

Salinity : practical scale of salinity 1978 (PSS 78)

Sigma : equation of state for seawater 1980 (EOS 80)

Potential Temperature : IPTS 90

JADE 95 Station 15 – (14 Nov 95)

STATION 15

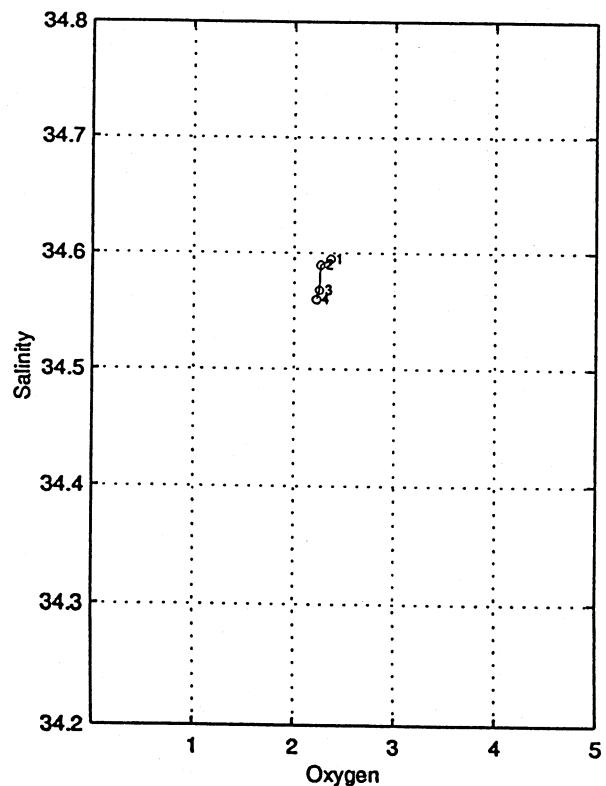

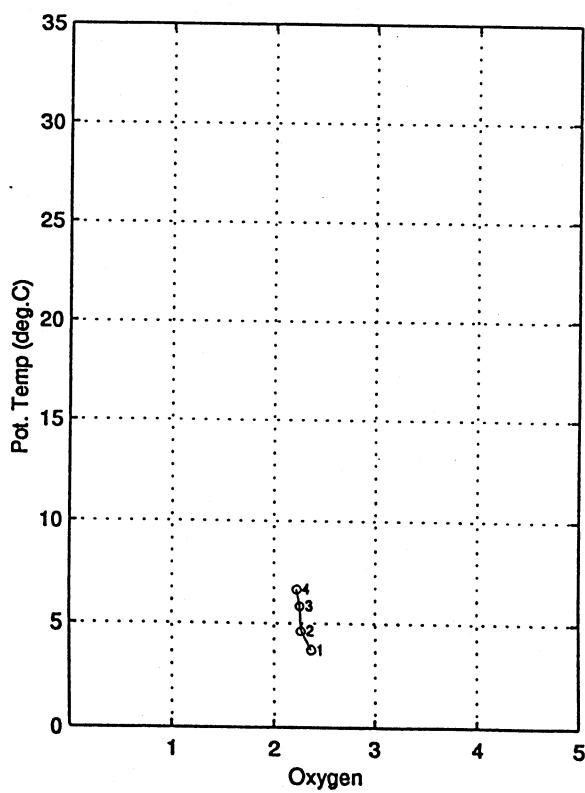

JADE 95

Oxygen Profile

Bathysonde : Guildline INSU-Brest

Area : South Banda & Timor Sea - Indonesia

Cruise name : JADE95 - R/V Baruna Jaya I

98/10/13
17:20:51

listacor_16

1

JADE 95

station : 16.00

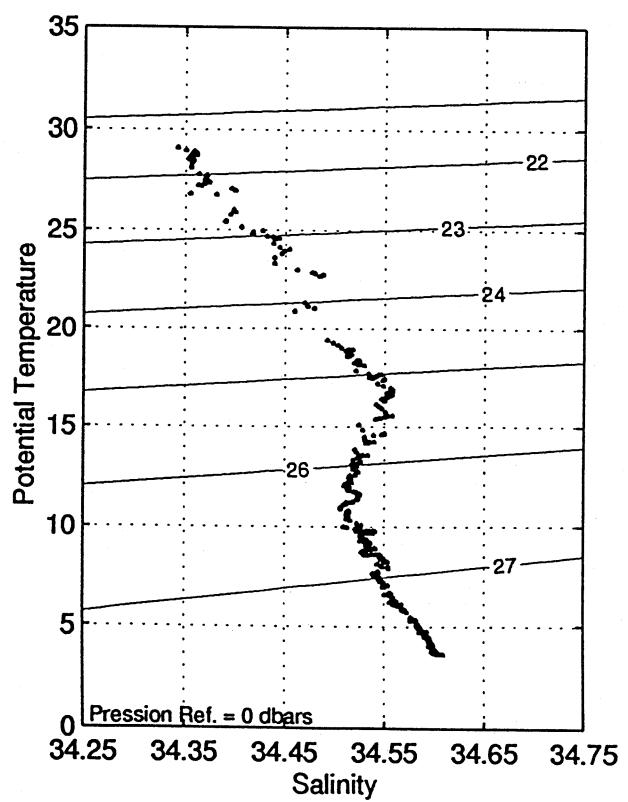

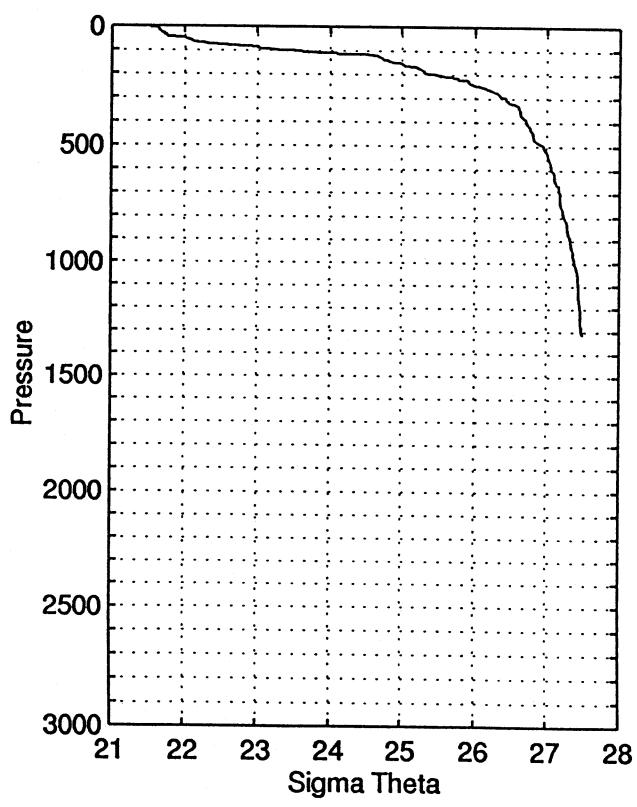

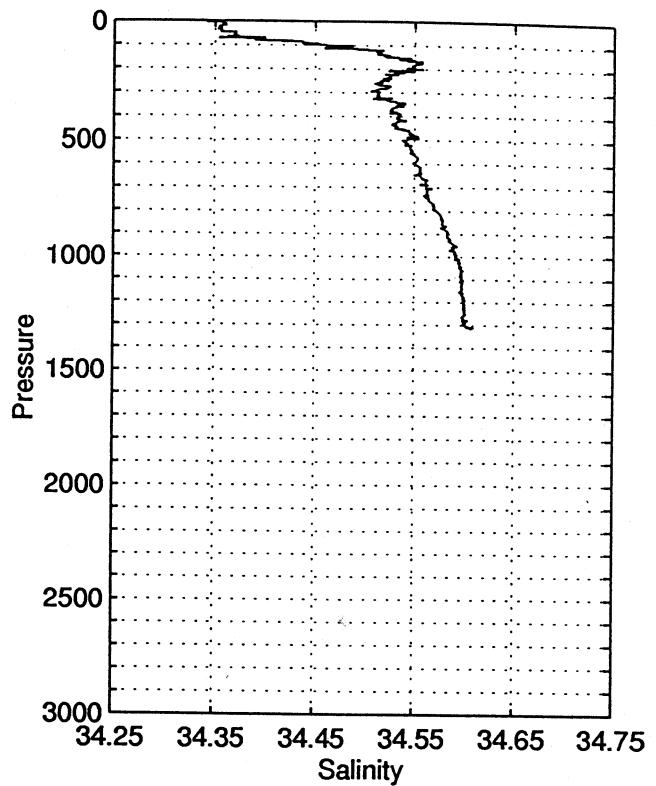

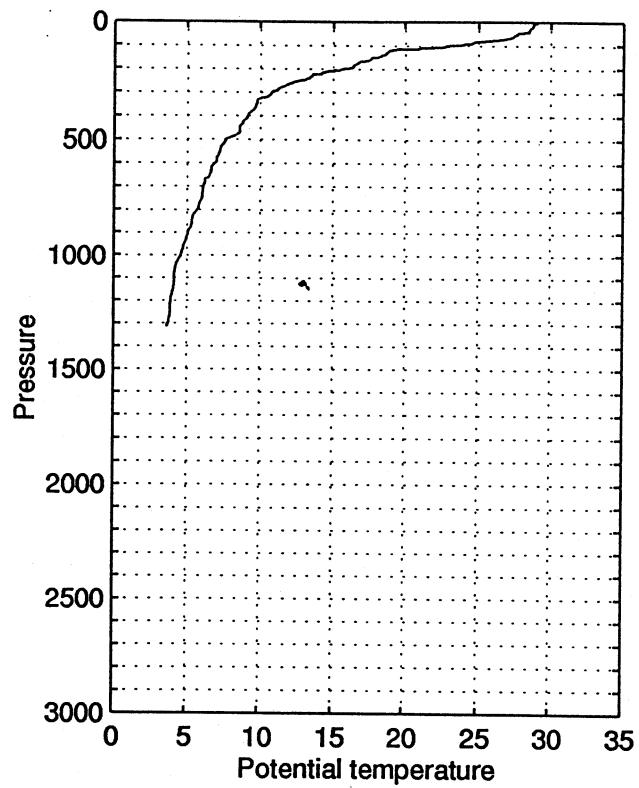

data reduction: 1 dbar

le 14/11/1995 a 8.55 tu -8.0230 126.2740 depth : 1986 m (2007.dbar)

JADE 95 Station 56 – (30 Nov 95)

STATION 56

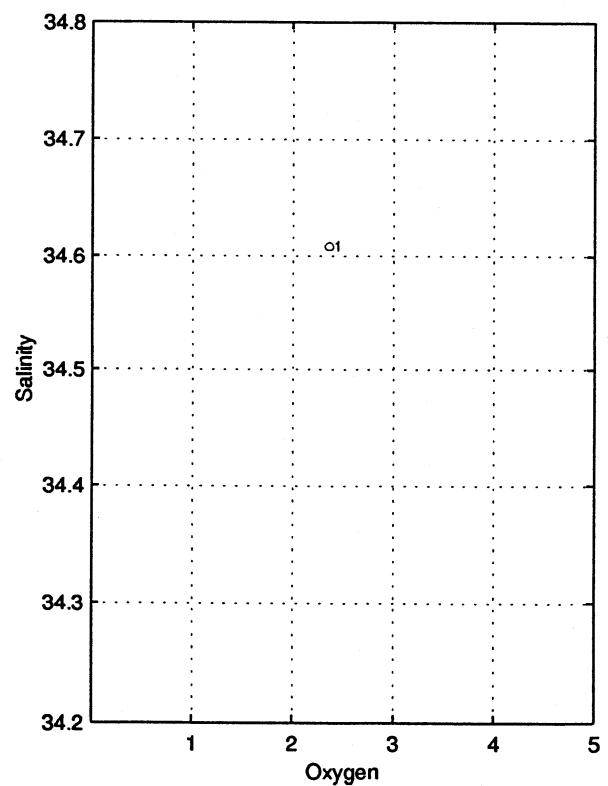

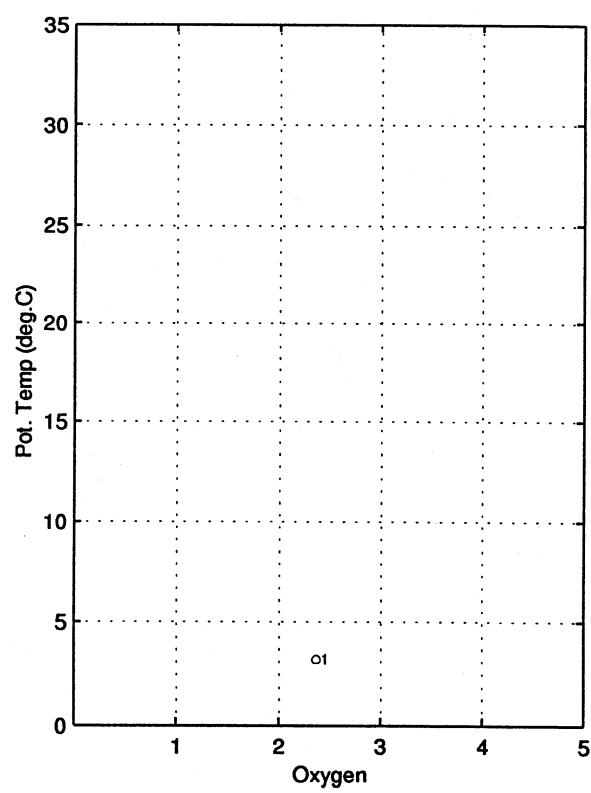

JADE 95

Oxygen Profile

Bathysonde : Guildline INSU-Brest

Area : South Banda & Timor Sea – Indonesia

Cruise name : JADE95 – R/V Baruna Jaya I

98/10/14
10:11:02

listacor_57

JADE 95

station : 57.00

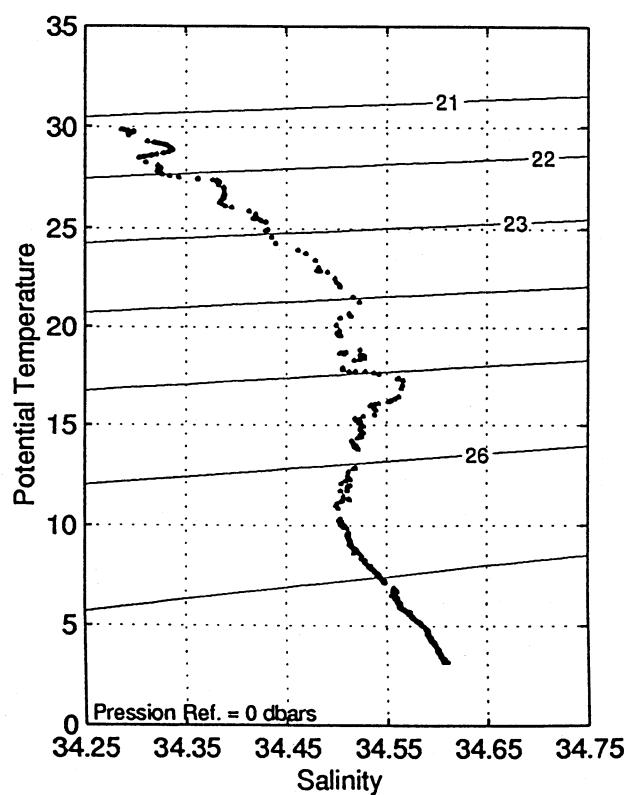

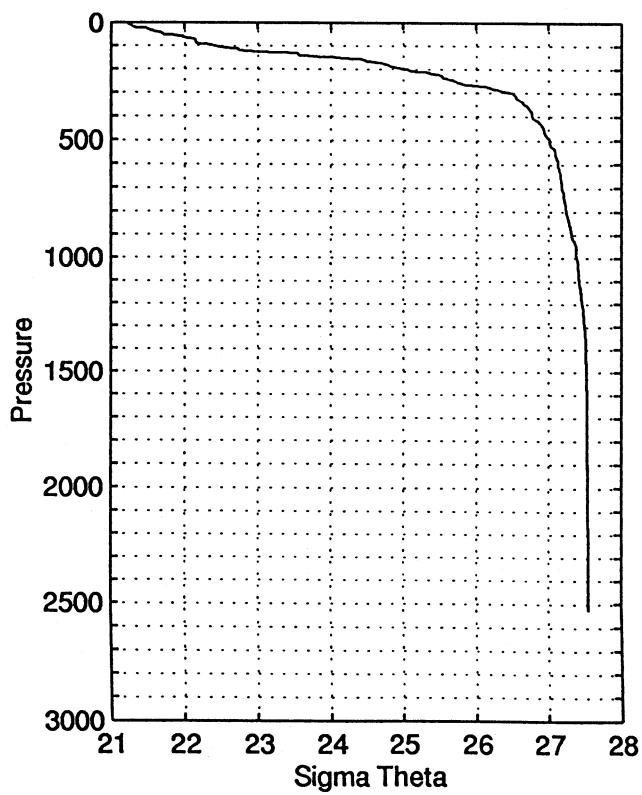

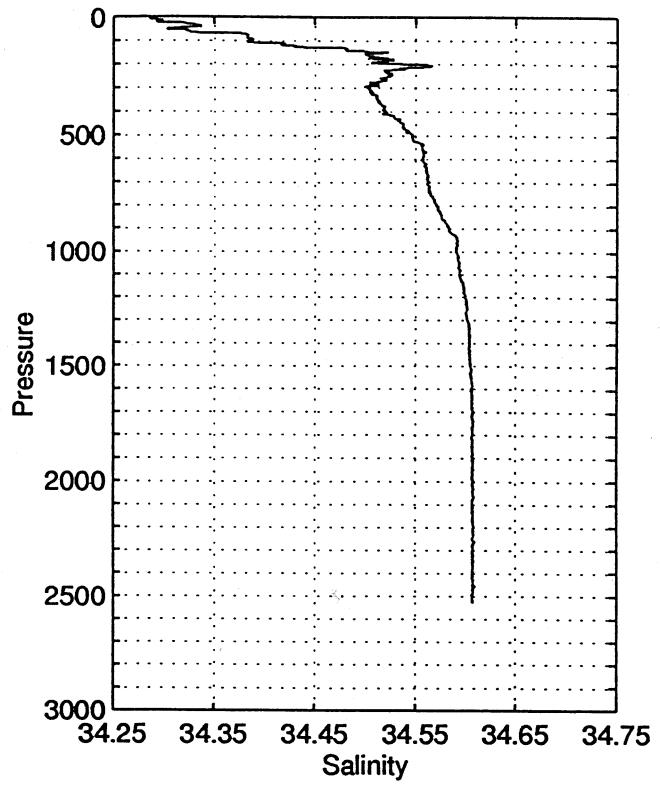

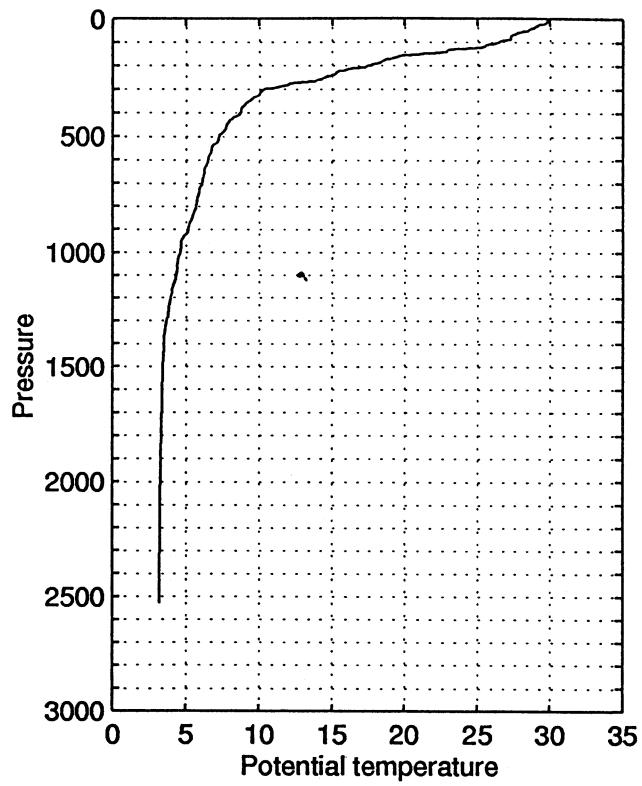

data reduction: 1 dbar

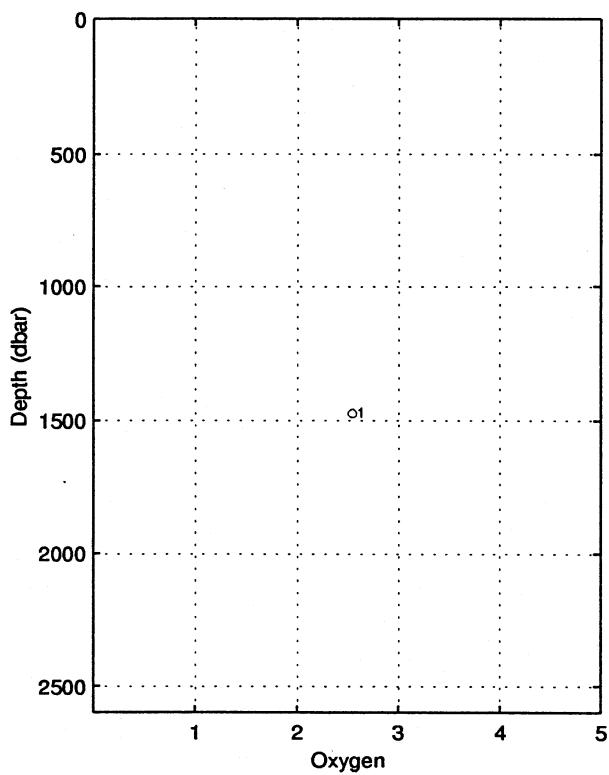

le 30/11/1995 a 22.42 tu -8.5515 123.4698 depth : 3250 m (3294.dbar)
